Microchip RF Handheld Development System Limitations

The Microchip RF Handheld Development System (“HHDS-MT”) is intended for use by engineers for the purpose of evaluating the feasibility of implementing the Radios, Inc. RF modules in various wireless applications. The user’s environment must be limited to use of the development system within an environment which provides for adequate isolation of RF emissions which might be caused by operation of the HHDS-MT. In field testing, the device must not be operated in a residential area or any area where radio devices might be subject to harmful electrical interference. The development system has not been certified for use by the FCC in accord with Part 15, ETSI I-ETS 300 220 or I-ETS 300 220-1 regulations, or other known standards of operation governing radio emissions. Distribution and sale of the HHDS-MT is intended solely for use in future development of devices which may be subject to FCC regulation, or other authorities governing radio emission. HHDS-MT may not be resold by users for any purpose. Accordingly, operation of the HHDS-MT in the development of future devices is deemed within the discretion of the user and the user shall have all responsibility for any compliance with any FCC regulation or other authority governing radio emissions of such development or use, including without limitation reducing electrical interference to legally acceptable levels. All products developed by user must be approved by the FCC or other authority governing radio emission prior to marketing or sale of such products and user bears all responsibility for obtaining the FCC’s prior approval, or approval as needed from any other authority governing radio emissions.

HHDS-MT is an experimental device, and Radios, Inc. makes no representation with respect to the adequacy of the HHDS-MT in developing low-power wireless data communications applications or systems, nor for the adequacy of such design or result. Radios, Inc. does not and cannot warrant that the functioning of the HHDS-MT will be uninterrupted or error-free.

The HHDS-MT and products based on the technology in the HHDS-MT operate on shared radio channels. Radio interference can occur in any place at any time, and thus the communications link may not be absolutely reliable. Products using the HHDS-MT technology must be designed so that a loss of communications due to radio interference or otherwise will not endanger either people or property and will not cause the loss of valuable data. Radios, Inc. assumes no liability for the performance of products which are designed or created using the HHDS-MT. Radios, Inc.’s products are not suitable for use in life-support applications, biological hazard applications, nuclear control applications, or radioactive areas.

Microchip RF Handheld Development System Warranty

Radios, Inc. warrants solely to the purchaser that the hardware components of the Microchip RF Handheld Development System (HHDS-MT) will be free from defects in materials and workmanship under normal use for a period of 90 days from the date of shipment by Radios, Inc. This limited warranty does not extend to any components or circuits which have been subjected to modification, misuse, neglect, accident, or improper installation or application. Radios, Inc.'s entire liability and the purchaser's sole and exclusive remedy for the breach of this Limited Hardware Warranty shall be, at Radios, Inc.'s option, when accompanied by a valid receipt, either (i) repair or replacement of the defective components or (ii) upon return of the defective HHDS-MT, refund of the purchase price paid for the HHDS-MT. EXCEPT FOR THE LIMITED HARDWARE WARRANTY SET FORTH ABOVE, RADIOS, INC. AND ITS LICENSORS PROVIDE THE HARDWARE ON AN "AS IS" BASIS, AND WITHOUT WARRANTY OF ANY KIND EITHER EXPRESS, IMPLIED OR STATUTORY, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF NONINFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Some states do not allow the exclusion of implied warranties, so the above exclusion may not apply to you. This warranty gives you specific legal rights and you may also have other rights which vary from state to state.

Limitation of liability. IN NO EVENT SHALL RADIOS, INC. OR ITS SUPPLIERS BE LIABLE FOR ANY DAMAGES (WHETHER SPECIAL, INCIDENTAL, CONSEQUENTIAL OR OTHERWISE) IN EXCESS OF THE PRICE ACTUALLY PAID BY YOU TO RADIOS, INC. FOR THE HHDS-MT, REGARDLESS OF UNDER WHAT LEGAL THEORY, TORT, OR CONTRACT SUCH DAMAGES MAY BE ALLEGED (INCLUDING, WITHOUT LIMITATION, ANY CLAIMS, DAMAGES, OR LIABILITIES FOR LOSS OF BUSINESS PROFITS, BUSINESS INTERRUPTION, LOSS OF BUSINESS INFORMATION, OR FOR INJURY TO PERSON OR PROPERTY) ARISING OUT OF THE USE OR INABILITY TO USE THE HHDS-MT, EVEN IF RADIOS, INC. HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. BECAUSE SOME STATES DO NOT ALLOW THE EXCLUSION OR LIMITATION OF LIABILITY FOR CONSEQUENTIAL OR INCIDENTAL DAMAGES, THE ABOVE LIMITATION MAY NOT APPLY TO YOU.

1. Microchip RF Handheld Development System Introduction

1.1 General Description

The Microchip RF Handheld Development System comprises the hardware and firmware resources commonly used by wireless designers in the design and development of wireless applications. The Microchip RF Handheld Development System (“HHDS-MT”) offers a comprehensive test suite that allows the developer/designer to vary a number of electrical firmware and antenna parameters to facilitate the optimal architecture and topology for the given application being developed.

1.2 Intended User

The Microchip RF Handheld Development System (“HHDS-MT”) is intended for use solely by engineers for the purpose of evaluating the feasibility of implementing the Radios, Inc. RF modules in various wireless applications. The user’s evaluation must be limited to use of the development system within an environment which provides for adequate isolation of RF emissions which might be caused by operation of the HHDS-MT. In field testing, the device must not be operated in a residential area or any area where radio devices might be subject to harmful electrical interference. This kit has not been certified for use by the FCC in accord with Part 15 ETSI I-ETS 300 220 or I-ETS 300 220-1 regulations or other known standards of operation governing radio emissions.

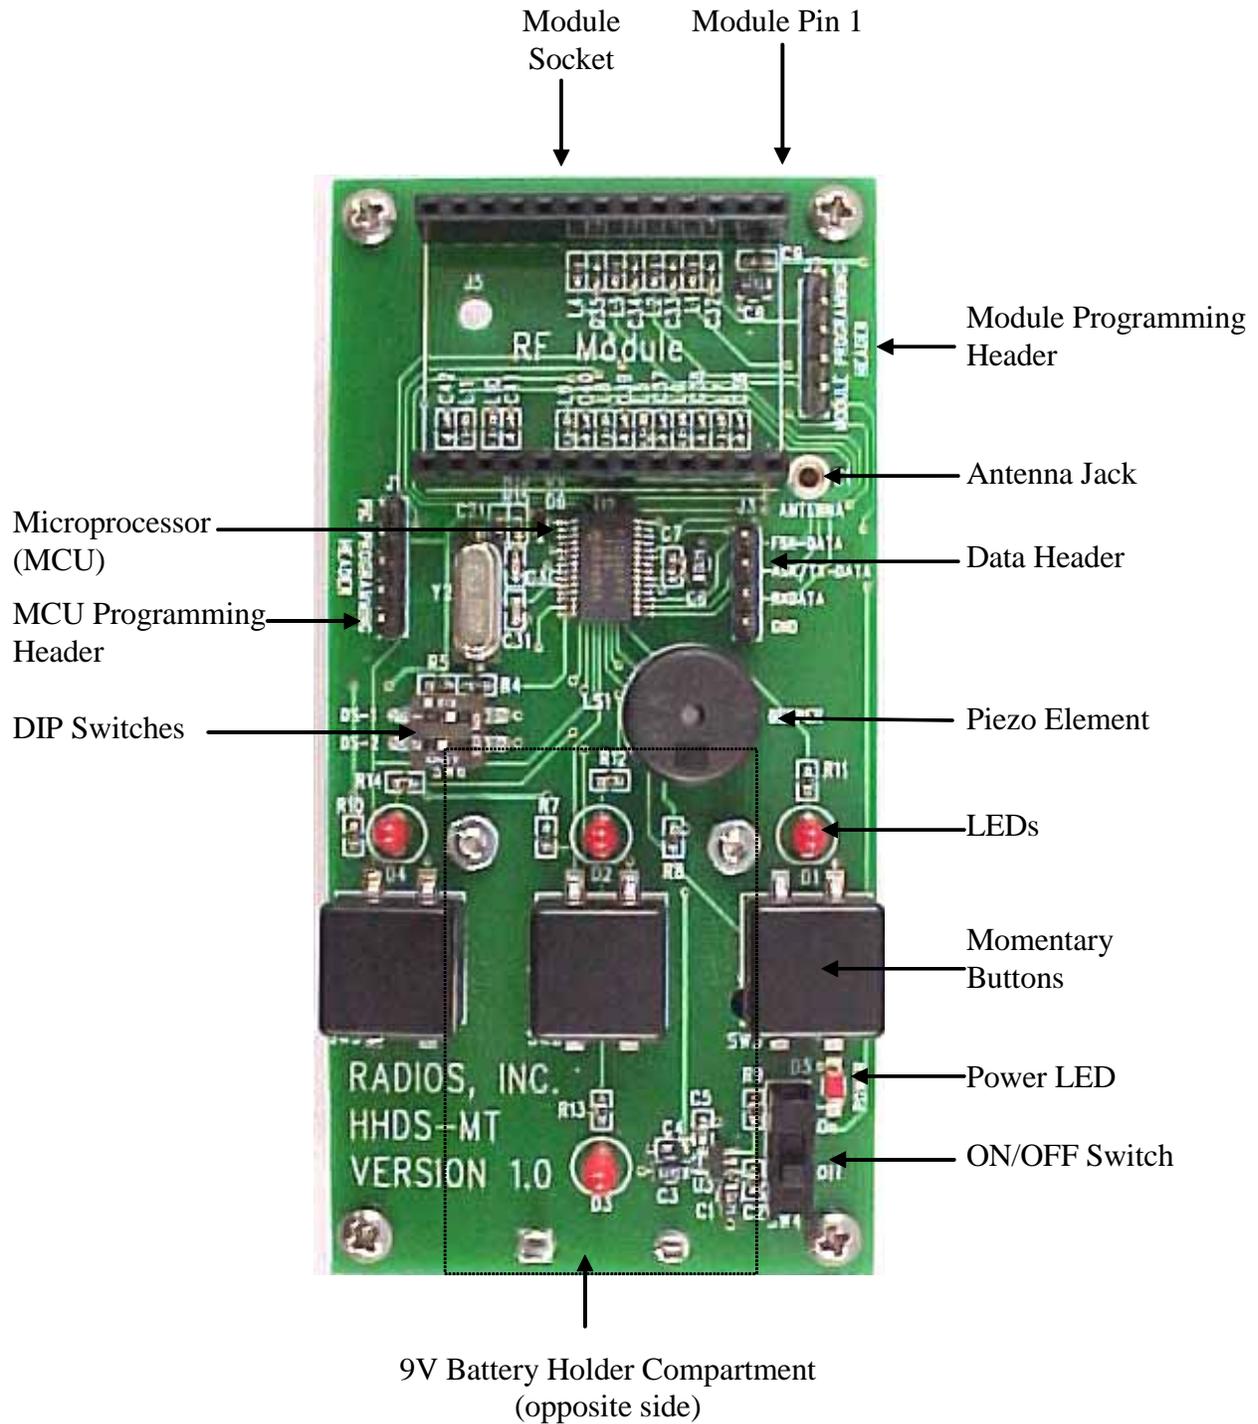

FIGURE 1

2.2 Getting Started

Required Equipment:

HHDS-MT (Microchip RF Handheld Development System)

- Two HHDS-MT development boards (Figure 1)
- Two antennas
- Two 9 volt batteries
- HHDS-MT user's manual

Setup:

1. Select a location that lends itself to wireless testing, i.e., line-of-sight with as few metal objects and RF pathway obstructions as practical.
2. Ensure that dipswitch settings match that required for the module being tested. See page 9 for dipswitch settings. Units are shipped with the radios interfaced to microcontroller.
3. Insert desired module into socket indicated by “Module Socket” in Figure 1.
4. Install 9 volt battery in holder underneath each development board.
5. Install one monopole antenna per unit into PCB mounted jacks indicated by “Antenna Jack” in Figure 1.
6. Turn power switch to the “ON” position, and you are ready to test.

3 Assembly and HHDS-MT Overview

3.1 Assembly of Handheld Development System

The Microchip Handheld Development System comes assembled in a default configuration for immediate evaluation except for battery and antenna installations.

3.2 DIP Settings

Dip Switch Configurations

| Module | DIP1 | DIP2 |
|-------------|------|------|
| MRX-MT04/09 | OFF | OFF |
| MTX-MT75 | ON | OFF* |

* - Turning on Dip Switch 2 causes the HHDS-MT to auto-transmit the packet 0xAA, 0xAA, 0xAA three times every second.

3.3 Power Supply and Regulation

The HHDS-MT units are power by a 9 volt alkaline cell and regulated with a Micrel MIC5205-3.3 voltage regulator. The board's VCC/VDD is therefore 3.3 volts.

3.4 Microcontroller (MCU) Section

All HHDS-MT's are supplied with a PIC16LF72 on-board 4 MHz, flash-based, microcontroller (MCU). The MCU can be reprogrammed repeatedly with an inexpensive programmer. It comes pre-programmed with sample code which allows the user to transmit and receive simple asynchronous protocol with its corresponding HHDS-MT unit. The sample code can be modified in an ASCII editor and reprogrammed according to the requirements of the user's application. The MCU is connected to the module's data input and output pins, programming pins for the module, reference clock, RSSI pin, transmitter and reference clock enable pin, two general purpose I/O pins, as well as, four LEDs, three momentary buttons, and a piezo element.

The MCU comes pre-programmed with embedded firmware which supports simple, asynchronous communication between both HHDS-MT development boards. The sample code includes a basic method for preemption detection and LED activation as well as a warbling beep routine to drive the on-board piezo element.

3.5 Antenna Options and Interfaces

The HHDS-MT allows for several different antenna types such as monopole whip, helical, helically loaded whips and others. There is one antenna feed port: direct PCB mount via the on-board jack. The units are shipped with one or two monopole whip antennas which are inserted directly into the antenna jack. (Figure 1)

3.6 Module Section

This is where the module chosen for evaluation is inserted. Attention should be given to reference pin 1 correctly.

4 Operation Instructions and Guidelines

4.1 Theory of Operation

The HHDS-MT system employs one RF module. Transmission and reception of wireless data is controlled by microprocessor.

The development boards ship with a PIC16LF72 microprocessor. After applying power, the wireless communication can be initiated by auto-transmit via the DIP switch settings (see section 3.2 - DIP Settings) or by the depression of the momentary buttons (see section 4.3 - LED, Piezo and Button Functions). The data packet sent is a simple three byte word preceded by a two byte preamble to place the comparator threshold of the receiving module in at optimal bias for reception of the first byte of data.

As the receiving module demodulates the received data from the transmitter, the IC's data output is sent to the MCU for processing. The sample firmware will acknowledge a valid data packet by responding with a beep.

The units come with two monopole antennas which employ the ground plane of the HHDS-MT board itself as a reference. The socket the antennas use will also accept other antennas with diameters between 0.048"-0.064".

4.2 I/O Interface

The HHDS-MT includes three headers: one data and two programming. The programming header on the right side of the HHDS-MT (J2) is for programming the microcontroller on the inserted module. The programming header on the left side of the HHDS-MT (J1) is for programming the microcontroller on the HHDS-MT. The data header includes four pins. The one is connected to ground. The other three are connected to the data pins of the module. The RXDATA pin is used for accessing incoming data on the receiver modules (MRX-MT04/09). The ASK/TX-DATA and FSKDATA pins are used for accessing the ASK and FSK data of the MTX-MT75 transmitter module.

4.3 LED, Piezo and Button Functions

The development system is shipped such that a depression of the left button (SW5) on the HHDS-MT will prompt the transmission of one data packet with a three byte word consisting of 0x55, 0x55, 0x55. Depression of the center button (SW2) prompts the transmission of the data packet with a three byte word containing 0x55, 0x55, 0xAA. Depression of the right button (SW3) prompts the transmission of the data packet with a three byte word containing 0x55, 0xAA, 0xAA. The LED will light also to indicate that a transmission did indeed occur. The piezo element in turn is prompted to warble as an indication of a valid reception of one data packet.

5 Developing Applications

5.1 An RF solutions Overview

The Radios, Inc. RF modules are made for FM/FSK (Frequency Shift Keyed) for remote wireless applications, employing Microchip RF technology. All RF and IF tuning is accomplished automatically within the module, which eliminates manual tuning and reduces production costs. Receiver functions are completely integrated. The result is a highly reliable yet extremely low cost solution for high volume wireless applications. Because the module is a true single-chip radio receiver, it is extremely easy to apply, minimizing design and production costs, and improving time to market.

The Microchip RF solutions are direct conversion (Zero-IF) half-duplex data transceivers for establishing a frequency-agile, half-duplex, bi-directional RF link with non-return to zero data coding. They are intended for applications in the 433 MHz, 868 MHz, and 915 MHz frequency bands and use 2-level FSK modulation. Their ability to operate with 25 kHz channel spacing makes them compliant with requirements of ETSI EN300 220-1 as well as making them ideal for automatic meter reading and social alarms.

The receiver section of the Microchip RF solutions converts the incoming 2-level FSK modulated signal into a synchronized bit stream and also includes a low-noise amplifier, down-conversion mixers, baseband filters, baseband amplifiers, and limiters.

The transmitter section performs the modulation of the carrier by an input baseband data signal and the transmission of the modulated signal. The frequency synthesizer is modulated directly. The modulated signal is then amplified by the on-chip RF power amplifier. The output power is user-programmable to one of four possible values. The frequency deviation and the bit rate for the transmit signal are the same as those programmed for the receiver section. User-defined pre-filtering should be enabled to ensure compliance with the requirements of the ETSI EN 300 220-1 regarding transmission at 25 kHz channel spacing.

The frequency synthesizer generates the local oscillator (LO) signal for the receiver section as well as the FSK modulated signal for the transmitter section. The core of the synthesizer is implemented with a PLL structure. The frequency is user-programmable with a minimum frequency resolution of 500 Hz in the 3 frequency bands: 433 MHz, 868 MHz and 915 MHz.

5.2 Antenna Design Considerations

Two types of antennas are normally associated with HHDS-MT applications, (1) quarter-wave monopole, and (2) helical (coil). Of these antenna types, the quarter-wave monopole is preferred, giving the best range performance. Typical SR and SH receivers employing quarter-wave monopole antennas generally provide about 100 meters open field range. The Radios, Inc. RF modules are designed to be connected to a quarter-wave monopole antenna at its input ANT pin, with no further coupling network, and provide this similar range. Of course, the monopole can be a free-standing “wire,” or a metal trace built directly into the pcb. The antenna need not be a quarter-wavelength long, but shorter lengths will reduce range. Although the other two antenna types, helical and pcb loop, are less efficient antennas than the monopole, they provide cost and/or ergonomic advantages. The pcb loop antenna is a very inexpensive structure to produce, being built into the pcb. The only requirement is that there be enough “room” on the pcb to build a sufficiently effective antenna. This antenna has the further advantage that it can be hidden from the end-user. The primary disadvantage is that this is usually the least efficient of the three antenna types being discussed, with a typical range of 30 meters. Loop antennas are more commonly found in transmitters than receivers. Where the antenna must be hidden, but still be rather efficient, a good choice is the helical antenna. The structure is simply a “coil” of wire, inexpensive, and easy to fabricate. Typical range for this type of antenna is 60 meters. (Both helical and pcb loop antennas are commonly found in transmitter designs, which usually requires a small unit with the antenna hidden from the user.) Another aspect of antenna selection, aside from its effectiveness at “picking-up” signal from the “ether,” is its directionality. Every type of antenna has its own signature of energy distribution in the 3-dimensional space that surrounds it. This signature is generally composed of “peaks” and “nulls”; if the transmit antenna “peak” is pointed at the receiving antenna’s “peak,” then range is maximized. However, optimizing this for a particular application or installation is generally not practical. All one can do in these cases is choose the antenna that meets the other constraints, like cost and form-factor, then test to determine if the system provides adequate range in all the required directions and orientations. Unfortunately, much of this work is empirical.

The antenna should be connected as closely as possible to the IC pin, minimizing parasitic inductance between the antenna pad and the pin. (Use a >25mil trace, <200mil long, if possible). The antenna can be located away from pin 1 of the device, but this requires using a transmission line from the antenna to the IC input pin and an impedance matching coupling circuit. We do not recommend such an approach for users who lack the necessary RF expertise and test equipment to design transmission line matching networks.

Suitable antennas are crucial to the success the application. Here are several key points to consider in designing antennas for your application:

Where possible, the antenna should be placed on the outside of the product. Also, try to place the antenna on the top of the product. If the product is “body worn”, try to get the antenna away for the body as far as practical.

Regulatory agencies prefer antennas that are permanently fixed to the product. Antennas can be supplied with a cable, provided a non-standard connector is used to discourage antenna substitution (these connectors are often referred to as “Part 15” connectors)

An antenna can not be placed inside a metal case, as the case will shield it. Also, some plastics (and coatings) significantly attenuate RF signals and these materials should not be used for product cases, if the antenna is going to be inside the case. The antenna designs used in the kit are included in the Drawings section of the manual. Many other antenna designs are possible, but efficient antenna development requires access to antenna test equipment such as a vector network analyzer, calibrated test antenna, antenna range, etc. Unless you have access to this type of equipment, the use of an antenna consultant is recommended. A patch or slot antenna can be used in some applications where an external antenna would be subject to damage. These types of antennas usually have to be designed on a case-by-case basis.

5.3 Bandwidth and Data Rate

Modules manufactured to a specific bandwidth or data rate can be requested from Radio, Inc.

5.4 Noise Management

Noise sources are found in all places and at all times. So the real question regarding noise generation and management is not IF but: how much, what frequency and at what amplitude. Radios which operate under FCC “Part 15” guidelines are subject to noise like any other receiver. Some noise sources commonly encountered by wireless developers are microprocessors, motors or fans, high frequency logic circuits among others. When there exist sufficient speed regarding the rise time and fall time of microprocessor clocks, harmonics can be found around critical frequencies of the receiver. If the option exists, the designer should choose a microprocessor that has the slowest rise and fall time possible for the given application to avoid problematic harmonics relative to the receiver. Switching power supplies, brush-type motors and other radio unfriendly devices should be avoided around the receive circuitry. Adequate bypass capacitors, chokes, series resistors and shielding can be helpful in managing such problems.

6 Low-power Radios and Regulatory Compliance

6.1 Electromagnetic Compliance

All low-power radio utilizing a frequency 9 Khz or about is subject to electromagnetic compliance and conformance. Often these devices use less than 1 mW or 0 dBm of power, operate shorter distances (1 to 1000 feet) and are simple in design. These devices are unlicensed meaning that they may be used without the end user having to apply for any other type of FCC authorization. In that the frequencies these devices use are shared by millions, one has to take occupied bandwidth inference into account when determining if the desired application is suitable for this regulatory area.

Normally part 15 or low-power radios are used for short-range low-cost applications where human life or safety are not considerations. Among some of these are remote controls for automotive and home alarms, garage door openers and simple contact closers among others. Data and telemetry is also another area where Part 15 devices are employed. HHDS-MT is intended to support the design of these types of low-power wireless applications. Most low-power wireless systems operate with few interference problems. However, these systems operate on shared radio channels, so interference can occur at any place and at any time.

6.2 A Regulatory Overview for The United States

Although the Radios, Inc. RF modules normally do not exceed the FCC regulations for unintentional radiation, the wireless developer should be aware of the requirements for the transmitter being used.

Non-licensed transmitters operate on a variety of frequencies. They must share these frequencies with licensed transmitters and are prohibited from causing interference to licensed transmitters.

The Federal Communications Commission (FCC) has rules to limit the potential for harmful interference to licensed transmitters by low-power, non-licensed transmitters. In its regulations, the FCC takes into account that different types of products that incorporate low-power transmitters have different potentials for causing harmful interference. As a result, the FCC's regulations are most restrictive on products that are most likely to cause harmful interference, and less restrictive on those that are least likely to cause interference.

This overview is intended to provide a general understanding of the FCC's regulations and policies applying to products using low-power transmitters. It reflects the current text and interpretations of the FCC's regulations. More detailed information is contained in the regulations themselves, which can be found in Part 15 of Title 47 of the Code of Federal Regulations.

Manufacturers and parties selling low-power, non-licensed transmitters, or products containing low-power, non-licensed transmitters, are strongly encouraged to review the FCC's regulations closely. Recognizing that new uses of low-power transmitters often generate questions that are not directly addressed in the regulations, we welcome inquiries or requests for specific interpretations. Occasionally, the FCC proposes changes to its regulations, generally to address industry concerns and/or as new uses of low-power transmission equipment appear.

The terms “low-power transmitter,” “low-power, non-licensed transmitter,” and “Part 15 transmitter” all refer to the same thing: a low-power, non-licensed transmitter that complies with the regulations in Part 15 of the FCC rules. Part 15 transmitters use very little power, most of them less than a milliwatt. They are “non-licensed” because their operators are not required to obtain a license from the FCC to use them.

Although an operator does not have to obtain a license to use a Part 15 transmitter, the transmitter itself is required to have an FCC authorization before it can be legally marketed in the United States. This authorization requirement helps ensure that Part 15 transmitters comply with the Commission’s technical standards and, thus, are capable of being operated with little potential for causing interference to authorized radio communications.

If a Part 15 transmitter does cause interference to authorized radio communications, even if the transmitter complies with all of the technical standards and equipment authorization requirements in the FCC rules, then its operator will be required to cease operation, at least until the interference problem is corrected.

Part 15 transmitters receive no regulatory protection from interference.

Changing the antenna on a transmitter can significantly increase, or decrease, the strength of the signal that is ultimately transmitted. Except for cable locating equipment, the standards in Part 15 are not based solely on output power but also take into account the antenna characteristics. Thus, a low power transmitter that complies with the technical standards in Part 15 with a particular antenna attached can exceed the Part 15 standards if a different antenna is attached. Should this happen it could pose a serious interference problem to authorized radio communications such as emergency, broadcast and air-traffic control communications.

In order to prevent such interference problems, each Part 15 transmitter must be designed to ensure that no type of antenna can be used with it other than the one used to demonstrate compliance with the technical standards. This means that Part 15 transmitters must have permanently attached antennas, or detachable antennas with unique connectors. A “unique connector” is one that is not of a standard type found in electronic supply stores.

It is recognized that suppliers of Part 15 transmitters often want their customers to be able to replace an antenna if it should break. With this in mind, Part 15 allows transmitters to be designed so that the user can replace a broken antenna. When this is done, the replacement antenna must be electrically identical to the antenna that was used to obtain FCC authorization for the transmitter. The replacement antenna also must include the unique connector described above to ensure it is used with the proper transmitter.

Hobbyists, inventors and other parties that design and build Part 15 transmitters with no intention of ever marketing them may construct and operate up to five such transmitters for their own personal use without having to obtain FCC equipment authorization. If possible, these transmitters should be tested for compliance with the Commission’s rules. If such testing is not practicable, their designers and builders are required to employ good engineering practices in order to ensure compliance with the Part 15 standards.

Home-built transmitters, like all Part 15 transmitters, are not allowed to cause interference to licensed radio communications and must accept any interference that they receive. If a home-built Part 15 transmitter does cause interference to licensed radio communications, the Commission will require its operator to cease operation until the interference problem is corrected. Furthermore, if the Commission determines that the operator of such a transmitter has not attempted to ensure compliance with the Part 15 technical standards by employing good engineering practices then that operator may be fined up to \$10,000 for each violation and \$75,000 for a repeat or continuing violation.

Operating a prototype of a product that is ultimately intended for market is not considered “personal use.” Thus, a party that designs and builds a transmitter with plans to mass produce and market a future version of it must obtain an experimental license from the FCC in order to operate the transmitter for any purpose other than testing for compliance with the Part 15 technical standards.

A Part 15 transmitter must be tested and authorized before it may be marketed. There are two ways to obtain authorization: certification and verification.

The **certification** procedure requires that tests be performed to measure the levels of radio frequency energy that are radiated by the device into the open air or conducted by the device onto the power lines. A description of the measurement facilities of the laboratory where these tests are performed must be on file with the Commission’s laboratory or must accompany the certification application. After these tests have been performed, a report must be produced showing the test procedure, the test results, and some additional information about the device including design drawings. Certified transmitters also are required to have two labels attached: an FCC ID label and a compliance label. The FCC ID label identifies the FCC equipment authorization file that is associated with the transmitter, and serves as an indication to consumers that the transmitter has been authorized by the FCC. The compliance label indicates to consumers that the transmitter was authorized under Part 15 of the FCC rules and that it may not cause, nor is it protected from, harmful interference. The FCC ID. The FCC ID must be permanently marked (etched, engraved, indelibly printed, etc.) either directly on the transmitter, or on a tag that is permanently affixed (riveted, welded, glued, etc.) to it. The FCC ID label must be readily visible to the purchaser at the time of purchase.

The FCC ID is a string of 4 to 17 characters. It may contain any combination of capital letters, numbers, or the dash/hyphen character. Characters 4 through 17 may be designated, as desired, by the applicant. The first three characters, however, are the “grantee code,” a code assigned by the FCC to each particular applicant (grantee). Any application filed with the FCC must have an FCC ID that begins with an assigned grantee code.

The Grantee Code. To obtain a code, new applicants must send in a letter stating the applicant’s name and address and requesting a grantee code. This letter must be accompanied by a completed “Fee Advice Form” (FCC Form 159), and a \$45 processing fee.

The Compliance Label. The applicant for a grant of certification is responsible for having the compliance label produced and for having it affixed to each device that is marketed or imported. The wording for the compliance label is in Part 15, and may be included on the same label as the FCC ID, if desired. The compliance label and FCC ID label may not be attached to any devices until a grant of certification has been obtained for the devices.

Once the report demonstrating compliance with the technical standards has been completed, and the compliance label and FCC ID label have been designed, the party wishing to get the transmitter certified (it can be anyone) must file a copy of the report, an “Application for Equipment Authorization” (FCC Form 731) and an \$845 application fee, with the FCC.

After the application is submitted, the FCC’s lab will review the report and may or may not request a sample of the transmitter to test. If the application is complete and accurate, and any tests performed by the FCC’s lab confirm that the transmitter is compliant, the FCC will then issue a grant of certification for the transmitter. Marketing of the transmitter may begin after the applicant has received a copy of this grant.

Typically, 90% of the applications for certification that the FCC receives are processed within 30 calendar days. This time frame may increase due to incomplete applications and pre-grant sampling, if determined to be necessary.

The **verification** procedure requires that tests be performed on the transmitter to be authorized using a laboratory that has calibrated its test site or, if the transmitter is incapable of being tested at a laboratory, at the installation site. These tests measure the levels of radio frequency energy that are radiated by the transmitter into the open air or conducted by the transmitter onto the power lines. After these tests are performed, a report must be produced showing the test procedure, the test results, and some additional information about the transmitter including design drawings.

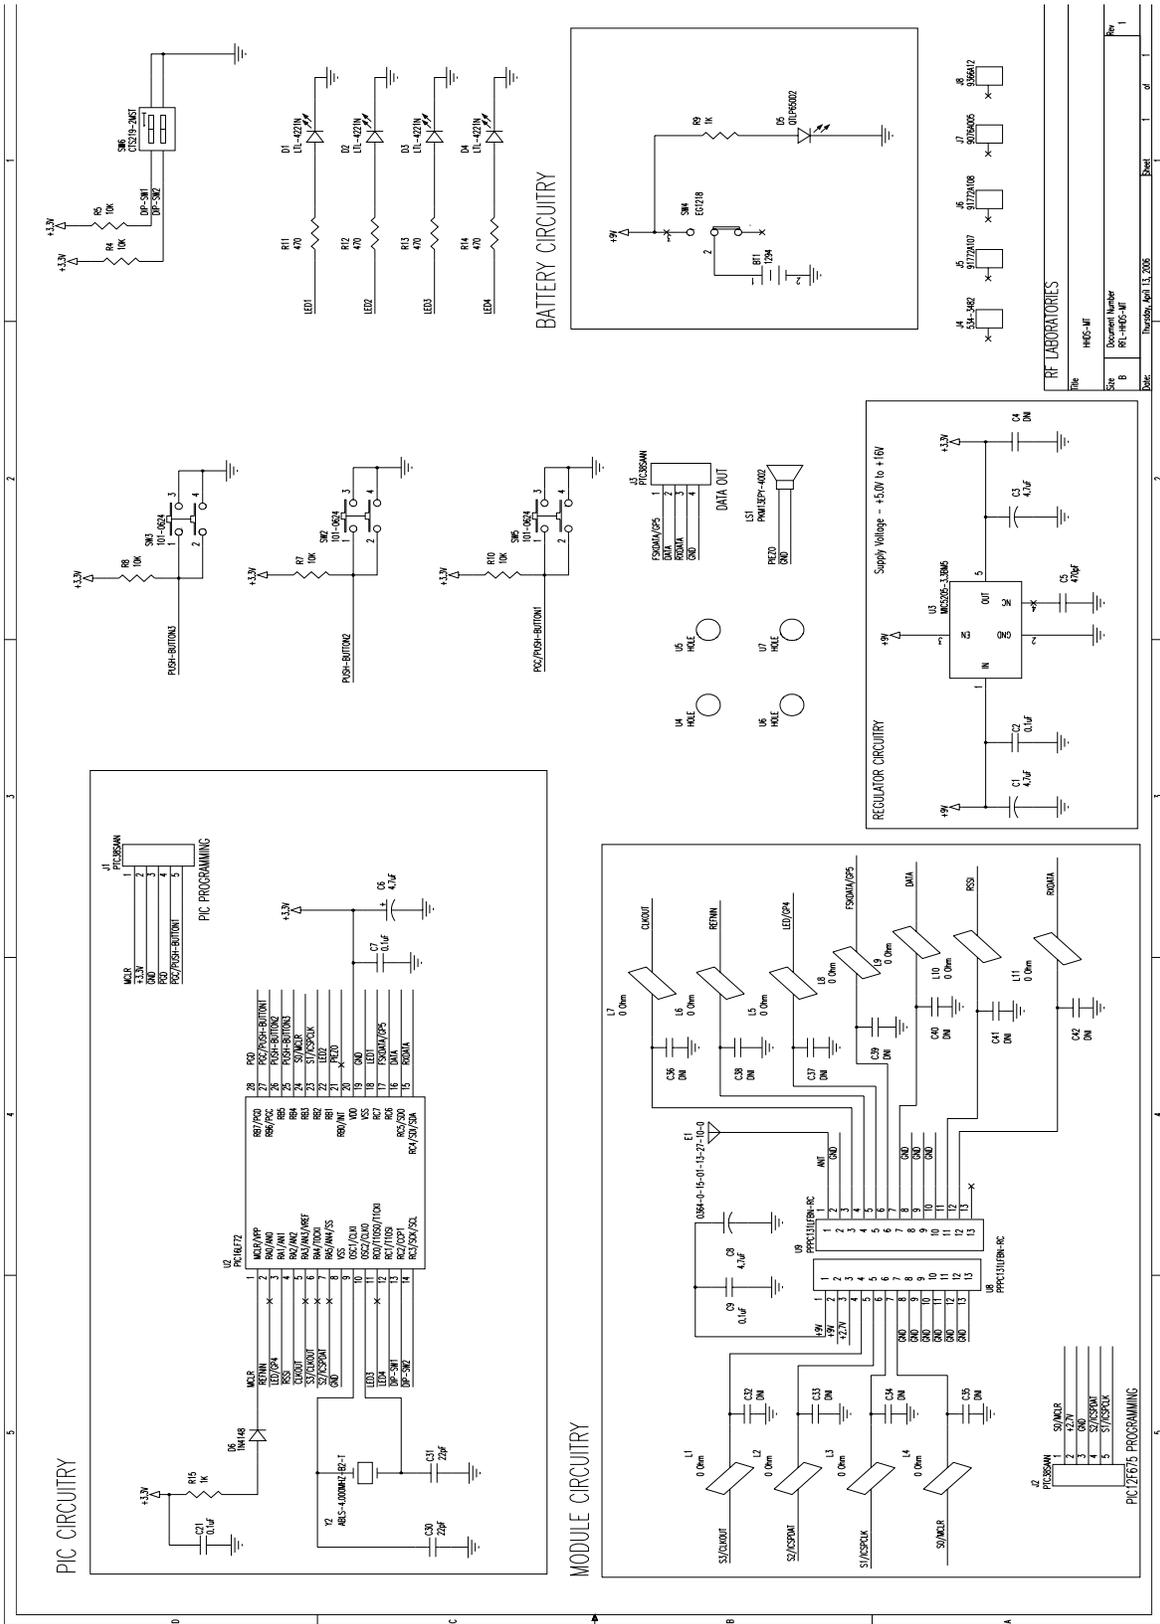

Once the report is completed, the manufacturer (or importer for an imported device) is required to keep a copy of it on file as evidence that the transmitter meets the technical standards in Part 15. The manufacturer (importer) must be able to produce this report on short notice should the FCC ever request it.

The manufacturer (or importer) is responsible for having the compliance label produced, and for having it affixed to each transmitter that is marketed or imported. Verified transmitters must be uniquely identified with a brand name and/or model number that cannot be confused with other, electrically different transmitters on the market. However, they may not be labelled with an FCC ID or in a manner that could be confused with an FCC ID.

Once the report showing compliance is in the manufacturer’s (or importer’s) files and the compliance label has been attached to the transmitter, marketing of the transmitter may begin. ***There is no filing with the FCC required for verified equipment.***

Any equipment that connects to the public switched telephone network, such as a cordless telephone, is also subject to regulations in Part 68 of the FCC Rules and must be registered by the FCC prior to marketing. The rules in Part 68 are designed to protect against harm to the telephone network.
